

Fossil hunting and climate labs for children and young people

Vattenhallen Science Center collaborates with researchers in almost all development of new exhibitions and activities. Vattenhallen's most important purposes are to work for broadened recruitment and to be an outreach arena for Lund University's researchers. At our stand in the poster session, you will meet PhD Johan Gren, paleontologist and deputy director at Vattenhallen, who, together with a designer and a communicator, has developed an activity where children can dig for 3D-printed dinosaur fossils. Jutta Holst, researcher and director of ICOS Sweden, will show a couple of climate laboratory exercises for school students in Vattenhallen and also talk about the Integrated Carbon Observation System (ICOS) and how they contribute with measurement data for monitoring greenhouse gas levels in the atmosphere in Europe.
